

AWS Step 9: How to set up authentication from the local PC

Click your account name on the right top and “Security credentials”

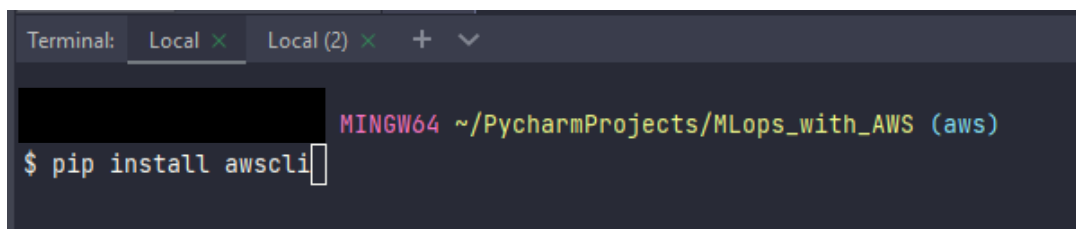

Click “Create access key”

Save the Secret Access Key (If you forget, you simply delete the key and remake it)

Go back to your local PC and open the terminal where you are working on the project.

Install awscli: pip install awscli

Type “aws configure” and provide your aws access key, then, secret key.

(Other parts are optional, so, just hit the enter.)
